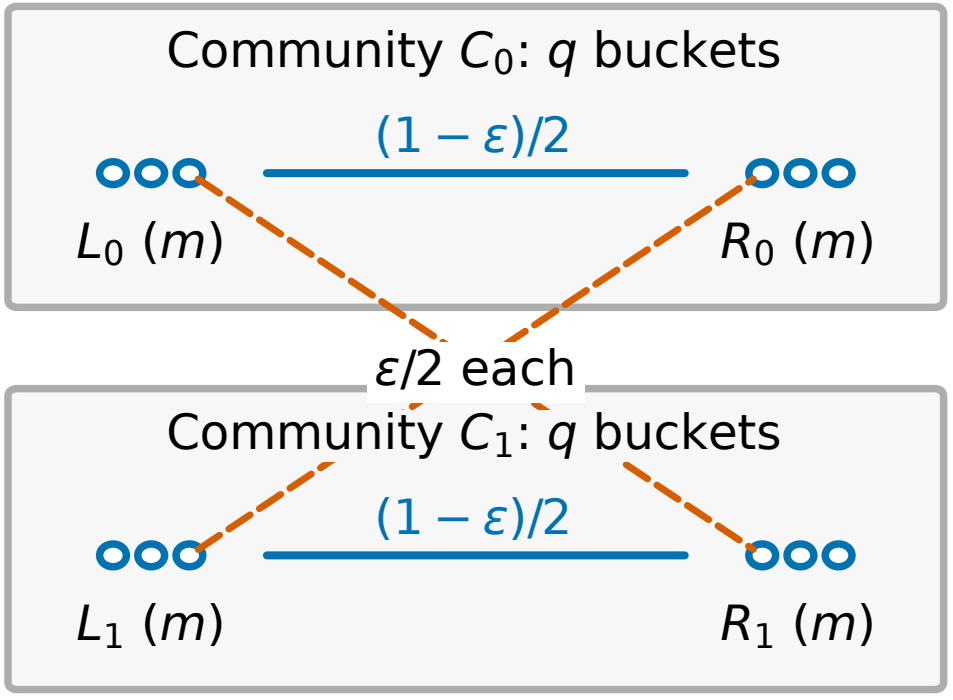
(a) Candidate structure



Choose the smaller load; left wins ties.

(b) Critical description

$$n_* = 2qc \sim \kappa q^2$$

$\varepsilon q \to \lambda$; slow time $t = n/q^2$

Community imbalance

$$D_q(t) = \Delta_n/q \;\longrightarrow\; D_t$$

phase averaged in drift

Overflow near capacity

$$Z_c(n_* + \lfloor 2hq \rfloor)/q \;\longrightarrow\; S_h(D_\kappa)$$

observation phase retained in readout
